

FLEXAIR

FlexAir is a flight booking and management application developed to demonstrate practical database design and programming concepts. The system allows users to search for flights, manage passenger information, create and cancel bookings, and view their booking history. User authentication and role-based access control are implemented to ensure secure and controlled access to data.

The application is built on a relational database structure with multiple interconnected tables, supported by SQL queries, views, functions, and triggers. Core business rules such as seat availability control and booking validation are enforced at the database level. FlexAir is deployed on a cloud-based platform and provides a realistic example of a modern flight reservation system.
